Executive Summary

On May 31, 2001, House Resolution 405 (“Resolution”) was adopted expressing concern over the availability of nitrogen oxide (“NOx”) emission allowances for new electric generation units under the federally required NOx SIP Call regulations adopted by the Illinois Pollution Control Board (“IPCB”). The Resolution directed the Illinois Environmental Protection Agency (“Illinois EPA”) to prepare an annual report to the General Assembly for seven years, beginning on October 31, 2001, regarding the availability of NOx allowances within the State and within the larger trading region established by U.S. EPA as part of the NOx SIP Call. This is the second of these annual reports.

Illinois EPA submitted the first report in October 2001. This report described the federal NOx SIP Call and the Illinois regulations adopted by the IPCB to enable the State of Illinois to meet those requirements. It addressed the background of this complex regulatory framework, the market-based nature of these regulations, and the effect of these regulations on existing electric generating units (“EGUs”) and on new or prospective EGUs in Illinois. The report also provided explanations of the methods for calculating NOx allocations and the mechanics and purposes of the new source set-aside and early reduction credits.

The development of the NOx trading budget is a critical part of these regulations. The trading budget establishes the total amount of NOx emissions allocated in the aggregate to EGUs in Illinois. The establishment of the growth rate, one of the critical determinants in setting the NOx budget, is an important issue for Illinois that remains unresolved. Although the U.S. Supreme Court has upheld the NOx SIP Call, the determination of growth rates was remanded to U.S. EPA for review and final action. Illinois EPA made extensive comments to U.S. EPA requesting revision of the Illinois growth factors to provide a larger growth for EGUs in Illinois. U.S. EPA responded to the court’s remand and the commenters’ concerns. U.S. EPA believed that the growth factors and the methodology to predict growth factors were reasonable. The explanations provided by the U.S. EPA in its response are not convincing. Illinois has joined a lawsuit in federal court that continues to challenge U.S. EPA’s determination of the growth rates for EGUs.

In addition, Illinois EPA continues to have discussions with U.S. EPA seeking a favorable resolution of the growth issue.

As a part of the NOx implementation process, the NOx SIP Call provides for the distribution of additional NOx allocations for sources who make NOx reductions ahead of that required by the NOx rules. Illinois has reserved 15,261 early reduction credits (ERCs) for its EGUs, and 2,427 ERCs for its non-EGUs. Of the early reduction credits reserved for both EGUs and non-EGUs, one-half are available for distribution for reduction made in 2001, one-half for reductions made in 2002. If there are allowances remaining in the relevant pool, they can be distributed to sources for reductions made in 2003. On or before November 1, 2001, Illinois EPA received requests for ERCs from the owners or operators of 16 EGUs. No requests were received from any non-EGUs. Upon review of the requests for ERCs, Illinois EPA determined that a total of 10,393 ERCs were earned by the 16 EGUs. Because the total requested ERCs exceeded the number of ERCs reserved for EGUs for 2001 (i.e., 7,630), Illinois EPA distributed 7,630 ERCs to all 16 units on a pro-rata basis. In doing the adjustment, fractions of allocations were rounded off, leaving five unallocated ERCs, which could not be allocated fairly between the 16 sources. These five ERCs will be held over for distribution in next year's allocation.

The market system for NOx trading that is the subject of this report begins operation in the summer of 2004. Much of the information needed to determine how the market is operating is not currently available. When it is fully functional, Illinois EPA will assess its operation and impact on the development of new EGUs in Illinois. Consequently, some of the analyses requested by the Resolution will need to be addressed by future annual reports.

1.0 Purpose and Introduction

On May 31, 2001, the Illinois General Assembly's House of Representatives adopted House Resolution 405 ("Resolution"), which addresses the complex economic and regulatory issues that the State of Illinois faces in the deregulation of electric generation in the State. The Resolution acknowledged the factors that the power generators face in their effort to generate electricity competitively, as well as the issues that arise for the State in establishing policies and regulations that impact electric generation, which can in turn significantly affect the economy of the State. A copy of the Resolution is included as Attachment 1 to this October 2002 report.

The Resolution requires Illinois EPA to prepare and submit a report to the General Assembly "regarding the availability of nitrogen oxide emissions credits within the State and within the trading region established by the United States Environmental Protection Agency." The Resolution requires Illinois EPA to submit this report to the General Assembly by October 31, 2001, and a report each year thereafter, ending with the final report in 2007.

Each report is to contain data regarding the use and availability of emission credits in Illinois and in the trading region, projections about the availability of credits in future years, any relationship between the cost of electricity and the availability of emission credits, and any recommendations for legislative or regulatory changes that may be necessary to encourage the development of new electric generating capacity in Illinois.

Illinois EPA submitted the first report in October 2001 that provided a thorough discussion of the regulatory framework of the trading program and availability of credits and other market systems for environmental compliance. This year's report provides updated information to that provided in last year's report but does not repeat the discussion of the regulatory framework for the NOx trading and control program. The reader is directed to the October 2001 report for that information. As was the case in the first report, the NOx SIP Call program is not yet in operation, so that a complete assessment of its operation cannot be made at this time. This report does review NOx implementation activities that have occurred during this current reporting period (October 2001-October 2002).

2.0 Status of Illinois' NOx Regulations

On November 8, 2001, U.S. EPA approved Subparts T, U and W of Title 35 of the Illinois Administrative Code, regulating NOx emissions from cement kilns, industrial boilers and turbines, and electricity generating units ("EGUs"), respectively (FR56449). With approval of these three sets of regulations, U.S. EPA concludes that Illinois has fully satisfied current (Phase I) requirements under the NOx SIP Call.

Along with the above regulations, Illinois EPA also submitted Subpart X, a voluntary NOx reduction program. The purpose of this Subpart is to implement Section 9.9(d)(3) of the Illinois Environmental Protection Act ("Act") by providing a method by which additional NOx allowances may be generated from non-participating NOx emission sources, for use by emission units subject to the requirements of Subparts U and W. U.S. EPA has not taken final action on Subpart X at this time but intends to conduct rulemaking on Subpart X in the near future after having further discussions with Illinois EPA.

3.0 Update on the NOx Trading Budget

On February 22, 2002 (FR8396), U.S. EPA published a proposed rule in response to the court decision on the NOx SIP Call, NOx SIP Call Technical Amendments and Section 126 rules. The proposed rule excludes portions of Georgia, Missouri, Alabama, and Michigan, and the entire State of Wisconsin from the NOx SIP Call. The proposed rule also established a NOx budget under the Phase II of the NOx SIP Call based on the emission reduction from the non-acid rain units and proposed a control level range of 82% to 91% for internal combustion engines. This proposal does not affect the EGU's trading budget for Illinois because emission reductions from non-acid rain combustion turbines are already included in the Illinois NOx regulations for EGUs, i.e., Subpart W of Part 217 of Title 35 IAC. It may affect the total State NOx budget depending upon the final U.S. EPA decision on the level of control for internal combustion engines, since the SIP Call (October 1998) was based on a 90% reduction from large internal combustion engines. U.S. EPA is expected to issue a final rule on the control level for internal combustion engines sometime in late 2002 or early 2003. States are required to submit SIP revisions

complying with the Phase II of the NO_x SIP Call within 12 months of final promulgation of the rulemaking. The compliance date for sources will be May 31, 2004, for all States except Georgia and Missouri for which the compliance date will be May 1, 2005.

Since the last report, another federal NO_x control initiative has been proposed. On February 14, 2002, President Bush announced the Clear Skies initiative, which sets strict, mandatory emissions caps for three of its worst harmful air pollutants – sulfur dioxide (SO₂), NO_x and mercury. On July 29, 2002, the Bush Administration announced that it has sent legislation to Congress to implement the President’s Clear Skies initiative, an aggressive plan to cut power plant pollution by 70 percent and protect public health. Clear Skies would provide the following:

- Cut sulfur dioxide (SO₂) emissions from power plants by 73 percent, from current emissions of 11 million tons to a cap of 4.5 million tons in 2010, and 3 million tons in 2018;
- Cut emissions of nitrogen oxides (NO_x) from power plants by 67 percent, from current emissions of 5 million tons to a cap of 2.1 million tons in 2008, and to 1.7 million tons in 2018;
- Cut mercury emissions from power plants by 69 percent, establishing the first-ever national cap on mercury emissions. Emissions will be cut from current emissions of 48 tons to a cap of 26 tons in 2010, and 15 tons in 2018.

For Illinois, based on the EGU’s 2001 NO_x emissions, this translates to a NO_x ozone season emissions cap of approximately 31,208 tons in 2008 and 24,520 tons in 2018. This compares to a cap of 30,701 tons established to meet the NO_x SIP Call.

3.1 Distribution of Early Reduction Credits

U.S. EPA established a Compliance Supplement Pool (“CSP”) for each jurisdiction subject to the NO_x SIP Call. The CSP could be used by states to provide additional

allowances to sources that would have difficulty in meeting the presumptive NO_x emission limit of 0.15 lbs/mmBtu and that have made some early reductions in NO_x emissions ahead of the required compliance date of the NO_x SIP Call. These early reductions are known as early reduction credits (“ERCs”). Any allowances issued through use of the CSP can only be used for compliance in the 2004 or 2005 control season.

The entire Compliance Supplement Pool available for ERCs in Illinois is 17,688 tons (65 *Fed. Reg.* 11230, March 2, 2000). Illinois EPA has reserved 15,261 ERC allowances for EGUs. The remaining ERC allowances are reserved for non-EGUs. Illinois EPA will allocate the ERCs as set forth in Section 217.770.

If a budget EGU reduces its NO_x emission rate as required by the applicable provisions of subsection (c) of Section 217.770 in the 2001, 2002, or 2003 control period, for use in the 2004 or 2005 control period, the account representative may request ERCs for such reductions. Illinois EPA will allocate ERCs to the budget EGU in accordance with the provisions set forth in Section 217.770.

The federal regulatory provisions governing the distribution of ERCs can be found at 35 Ill. Adm. Code 217.770 and 217.470. Of the 15,261 ERC allowances reserved for EGUs and the 2,427 allowances reserved for non-EGUs, Illinois requires that no more than half (7,630 for EGUs and 1,214 for non-EGUs) can be distributed to the sources making NO_x reductions for the 2001 ozone season. The other half will be allocated to sources making reductions for the 2002 ozone season. Any remaining allocations will be awarded to sources who make reductions in the 2003 ozone season on a pro-rata basis.

On or before November 1, 2001, Illinois EPA received requests for ERCs from the owners or operators of 16 EGUs. No requests were received from any non-EGUs. Upon review of the requests for ERCs, Illinois EPA determined that a total of 10,393 ERCs were earned by the 16 EGUs. Because the total requested ERCs exceeded the

number of ERCs reserved for EGUs for this period, Illinois EPA distributed 7,630 ERCs to all 16 units on a pro-rata basis. In doing the adjustment, fractions of allocations were rounded off, leaving five unallocated ERCs, which could not be allocated fairly between the 16 sources. Therefore those five ERCs were not allocated but will be included with the next allocation to be administered in 2002. Table A-1 in Appendix A to this report shows the distribution of 7,625 ERCs to various EGUs. Illinois EPA has posted the distribution of ERCs on its website: www.epa.state.il.us/air/NOx/.

3.2 New Source Set Aside

As mentioned above, Section 217.768 establishes a new source set-aside (“NSSA”) for “new” budget EGUs. A “new” budget EGU is one that commenced commercial operation on or after January 1, 1995, and does not receive allowances under Section 217.764. All budget EGUs, including new EGUs, must have an allowance for every ton of NOx emitted during the control period.

There are 1,535 allowances available for use by the new sources in Illinois, which started operation after January 1, 1995 and before May 1, 2003. As of the date of this report, no new source has applied for allowances from the NSSA account, therefore no allocations has been made.

3.3 Initial Allocation for 2004, 2005 and 2006

Illinois EPA is in the process of allocating NOx allowances to sources listed in the Appendix E and F of Part 217 of Title 35 of IAC. The total number of allowances available for distribution, after deducting 5% of the allowances for NSSA, is 29,166. The list of the EGUs and their 2004, 2005 and 2006 allocations are shown in Table A-2 in Appendix A to this report. This list will be posted on Illinois EPA’s website after a thorough quality assurance check is completed.

4.0 Growth-Related Issues

Illinois EPA's first report of October 2001 discussed the growth related issues in detail. This October 2002 report discusses recent developments in growth related issues. In the final federal NOx SIP Call, Illinois was afforded a growth rate of 8% for EGUs. The 8% growth projection for Illinois left the State with a growth rate that is substantially below the actual growth rate that has already occurred, with five years remaining in the time period in question.

In the comments on the growth factors, Illinois EPA proposed the application of a method by U.S. EPA for its growth factors that would have provided a reasonable basis for projecting growth in Illinois. In response to the court's decisions, U.S. EPA on May 1, 2002, published a final rule on Response to Court Remand on NOx SIP Call and Section 126 rule (67 Fed. Reg. 21866). U.S. EPA reviewed the heat input growth rates for EGUs and methodology used to develop those growth rates. Based on that review, U.S. EPA believed that the heat input growth rates and the methodology used to develop them were reasonable. In response to the court's and commenters' concerns, U.S. EPA stated that it had reviewed the new information concerning current activities. U.S. EPA believed that heat input projections are simply required to be reasonable, not to match actual heat input. In response to the alternative methodology, U.S. EPA stated that any alternative methodology for predicting State heat input would result in projected values for some states that would not match actual heat input in some future year. U.S. EPA believed that in most states, recent short-term data was an unreliable predictor of a state's heat input in the future. These are some of the explanations U.S. EPA provided in the notice to show that the growth factors and methodology they used to predict growth factors for EGUs were reasonable.

Illinois EPA reviewed the final rule and is not satisfied with the explanation provided by the U.S. EPA. Illinois has joined a lawsuit in federal court that continues to challenge U.S. EPA's determination of the growth rates for EGU's. In addition, Illinois EPA is continuing to have discussions with U.S. EPA in an attempt to persuade U.S. EPA to provide more growth and is

exploring various alternatives to U.S. EPA's growth rates methodology which would support a larger Illinois growth rate. It is not clear at this time how successful Illinois EPA will be in persuading U.S. EPA to provide a larger growth rate for Illinois EGUs.

5.0 Energy Availability

The EGUs that started commercial operation after January 1, 1995, are new EGUs. In the first report of October 2001, Illinois EPA stated that it had received a large number of permit applications to construct new EGUs in Illinois. This report provides updated information on the status of all the new EGUs and existing EGUs in Illinois.

5.1 New EGUs

Between October 2001 and October 2002, Illinois EPA issued operating permits to 38 new EGUs to operate with a total capacity of 3,309 megawatts (MW). There are a total of 122 EGUs that have operating permits, and their total capacity is 11,167 MW. Several permits have been either withdrawn or expired for 38 units for which construction permits were issued prior to October 2001. In addition, several permit applications were withdrawn before the issuance of construction permits. Illinois EPA received four new construction permit applications for eight new coal-fired boilers since October 1, 2001. Total electric generating capacity of these coal-fired boilers is 3,960 MW. As of October 1, 2002, there are 20 EGUs with a total capacity of 3,136 MW for which construction has been initiated, 65 EGUs with a total capacity of 5,793 MW for which construction is pending, and 39 EGUs with a total capacity of 11,183 MW for which the Illinois EPA is reviewing the permit applications for construction. Table A-3 in Appendix A to this report summarizes the current status of all of these new EGUs.

Illinois EPA reviewed the 2001 ozone season emissions data from all of the new EGUs that actually operated. In the 2001 ozone season 86 "new" units actually operated, and the actual NO_x emissions from all the new EGUs were 567 tons per

ozone season compared to their potential NOx emissions of 4,382 ton per ozone season. Table A-4 in Appendix A to this report summarizes the NOx emissions data for all of these new EGUs. As described in Section 3.2 of this report there are 1,535 allowances set aside for new sources to be used in each ozone season in 2004, 2005, and 2006. Illinois believes that based on the current activity the NSSA will be sufficient to meet the new sources needs.

5.2 Existing EGUs

Overall, NOx emissions activity has decreased somewhat from last year but is still significantly higher than that allowed for by the NOx SIP Call. Figure 5-1 describes the associated seasonal heat input for the large EGUs covered by the NOx SIP Call trading program, compared to that projected to occur to comply with the trading budget of the NOx SIP Call. In the 2001 ozone season, the NOx emissions from existing EGUs were 73,738 tons (excluding 567 tons from new EGUs) as compared to 100,610 tons of NOx in 2000 ozone season. The budget allocated for existing EGUs is 29,166 allowances for each of the 2004, 2005, and 2006 ozone season. However, existing EGUs are in the process of installing NOx control technologies to bring the NOx emissions down to the required budget level.

**Figure 5-1
ILLINOIS EGU OZONE ACTUAL HEAT INPUT**

6.0 Allowance Market

Illinois EPA's first report of October 2001 discussed in detail the mechanics of the allowance market, how it works, and how Illinois EPA will allocate 30,701 budget NO_x allowances to the EGUs in Illinois. Once allowances are allocated to the sources, they may start buying or selling among any source in any of the 22 jurisdictions subject to the NO_x SIP Call. There are no NO_x trading activities in Illinois to report at this time. Currently, a multi-state ozone group comprised of a number of the eastern states, the so-called "Ozone Transport Region" or OTR, is operating a NO_x cap and trade program. NO_x trading of OTR allowances has occurred for some time and only recently has the OTR started trading NO_x SIP Call allowances. However, to date very little trading activity in NO_x allowances has occurred to comply with the SIP Call regulations. This section discusses briefly the recent activities in the allowance market in the OTR region.

Although the NO_x SIP Call compliance schedule does not appear to be a problem for most utilities, there are lingering concerns about how they will function initially. Utilities, as a safeguard against problems with the control equipment, are buying 2003 and 2004 NO_x allowances. Although major problems are not expected, most companies want to ensure that

they have adequate credits on hand to operate their facilities should they experience problems with their control equipment.

As reported by NATSOURCE, in October 2002, the NO_x allowances for 2003/4 Vintage Stream were being traded at \$4,850/ton (average price of an allowance for 2003 to 2004) and 2003/7 Vintage Stream were being traded at \$3,900/ton (average price of an allowance for year 2003 through 2007). During the last year (October 2001 – October 2002), 2003/4 Vintage Stream NO_x allowances started at \$5,000/ton, decreased to around \$4,000/ton at the first of the year 2002, increased to around \$5,000/ton in the early Spring 2002, decreased to about \$4,500/ton in late Summer 2002, and then recovered to about \$5,000/ton in October 2002. For Vintage Stream 2003/7 NO_x allowances, prices started at \$3,500/ton in October 2001, and after a slight decrease to \$3,000/ton at the end of the year 2001, increased thru the year 2002, ending at \$3,900/ton in October 2002. Figure 6-1, provided by NATSOURCE provides an overall view of this NO_x allowance trading activity.

Two large stream trades affected SIP Call prices. A 2003 – 2005 stream traded at \$4,500/ton for a total of 180 tons per year. Another trade of 2003 – 2004 stream NOx allowances for \$4,500/ton was made for 136 tons/year. There was also interest in a 2003 – 2007 stream with a bid of \$3,000/ton and \$3,900/ton offered, but the trade was never completed. These early allowance prices give a slight indication as to what NOx allowances will cost when full NOx SIP Call trading is initiated when the NOx SIP Call program begins in May 2004.

7.0 Energy Conservation Initiatives

An increased level of interest and activity is being seen in Illinois to utilize renewable energy sources and recycled energy such as combined heat and power to lessen the electrical demands on the existing electrical power generation system. Other areas of interest include distributed generation, demand side energy conservation, and voluntary initiatives. These activities have the potential to provide the benefits of producing electrical power from non-polluting energy sources, increasing the operating efficiency of existing power generating equipment, and reducing the current and future demands on conventional fossil-fueled electrical generating units. Currently the contribution by these alternative energy sources and activities in providing electrical power or lessening electrical demands is minimal in most instances; however, the combined future potential of these activities can be looked to in providing relief to the anticipated tight market for NOx allowances that the electrical power generating facilities may be facing under the requirements of the NOx SIP Call if U.S.EPA's 8% growth rate is upheld by the courts.

7.1 Alternative Energy Sources

The first and probably the most publicized in the alternative energy portfolio are renewable energy sources, which includes wind, solar, hydropower, geothermal, and bioenergy. According to 2001 estimates provided by the American Wind Energy Association, if the wind potential for powering utility-scale wind turbines in Illinois were harnessed, the power produced would equal 61 million megawatt-hours or approximately 49 percent of the entire state's electrical consumption. However, of

the approximately 6,980 megawatts of wind energy potential in Illinois, only two 50 MW wind farms are anticipated to be harnessed and operational by the end of 2003, which means approximately 1.4% of the wind potential in Illinois is being utilized. In addition to wind power, Illinois also has a total of 64 operating facilities using photovoltaic, hydro, and bioenergy. Bioenergy is being used at 25 facilities, photovoltaic at 29 facilities, and hydropower at 10 facilities. The currently installed capacity of these renewable energy facilities represents an additional 100 MW.

Although the contribution from alternative sources is currently minimal, every 100 MW of electrical potential provided from such sources saves approximately 300 tons of NO_x emissions per ozone season when compared to the NO_x emissions from a 100 MW fossil-fueled powered plant in Illinois and using SIP Call control levels. Therefore, every 100 MW plant that uses alternative energy sources saves 300 NO_x credit allowances from the 30,701 NO_x credit allowances allocated to Illinois under the NO_x SIP Call. Those 300 NO_x allowance credits would not have to be drawn from the allotment and could be used to meet growth needs for plants located where renewable or alternative energy sources are not available.

Recycled energy uses the energy content of flared gases, wasted exhaust heat, and unused gas pressure drops to generate electricity. One example of recycled energy is combined heat and power (“CHP”). CHP utilizes the waste heat generated by power producing facilities to provide heating and cooling or for other productive purposes such as mechanical power, dehumidifying systems, or compressed air for industrial and commercial applications. While the average efficiency of power generation has remained around 33% since 1960, CHP systems can achieve overall energy efficiency levels of 70% or greater. The U.S. CHP Association has set a goal of achieving 65% design efficiency for new installations by the year 2005 and at installation costs 10% lower than they are today. If only 10% of the Illinois electrical generating plants could realize an improvement in efficiency from 33% to 65% through CHP, then 4,960 NO_x emissions per season could be saved based on 2000 NO_x emissions estimates and current plant operating efficiencies. Another example of recycled

energy is using the pressure drop from the pumps that are used to distribute natural gas. Currently, once the gas reaches its final destination any excess pressure left in the lines is vented to the atmosphere. This wasted energy could be harnessed to generate electrical power. Currently no applications of this energy recycling technique have been identified in Illinois.

There is a potential to generate approximately 14 percent of the current fossil-fueled electrical power by simply recycling waste energy streams in Illinois, according to Private Power LLC, an Illinois based firm specializing in recycling energy. Because the waste energy streams are produced on-site, the recycled electricity would be consumed locally, minimizing line losses and avoiding transmission and distribution system upgrades. In terms of NOx allowance credits, this would amount to saving over 4,300 NOx credit allowances of the 30,701 allocated by U.S. EPA's NOx SIP Call.

Distributed generation ("DG") is the concept of reliance on smaller interconnected de-centralized power producing units versus the current approach of reliance on larger centralized units. The DG approach is especially effective during peak demand periods. Not only is it more cost effective but also it is more reliable. Interconnecting the back-up power generation units from hospitals, fire and police stations, and rescue shelters, such as Chicago is doing in their downtown area, insures that these facilities can obtain power reliably during emergency situations or high electrical demand ozone days as well as relieving the burden that the local utility must provide during these times. The City of Chicago has essentially built a 10 MW "virtual" power plant by linking scattered back-up generators from eight police stations and three senior citizen centers in the downtown area.

Mayor Daley's 2001 Energy Plan blueprint calls for using DG to add 1.5 billion kilowatt hours of electricity to the city's power grid by 2010. This virtual power plant would not fall under the requirements of the NOx SIP Call since these individual power-generating units have less than 25 MW capacities. This DG project

alone could save approximately 1,200 tons of NO_x emissions per season in the Chicago area.

7.2 Demand Side Energy Initiatives

Demand side energy conservation involves minimizing the amount of electrical power required to operate a plant or facility through energy efficiency improvements and energy conservation. Simple things such as energy efficient lighting, heating, air conditioning, and office equipment coupled with improved insulation can lower energy demands substantially, according to U.S. EPA's EnergyStar data. If merely 5% of these opportunities were annually and cumulatively implemented throughout Illinois, the American Council for an Energy Efficient Economy predicts that by 2015 businesses could avoid \$13.3 billion in utility costs and reduce smog-forming nitrogen oxide emissions by about 15%. Relating these savings to the electrical generating community means that less power would need to be generated or approximately 4,600 fewer NO_x allowance credits could be used of the 30,701 Illinois allotment.

For Chicago's O'Hare Airport, Com Ed sets aside approximately 30 MW of electrical potential to provide for the airport's lighting needs. By improving the lighting efficiency of the O'Hare field operations by 10%, an estimated annual savings of 2.5 to 3.0 megawatts of electrical potential would result, which equates to 7.5 to 9.0 NO_x allowance credits. A 25% improvement in lighting efficiency would equate to 18.8 to 22.5 NO_x allowance credits. Detailed analysis of demand side savings for O'Hare operations is currently under consideration and will be an integral part of the airport modernization efforts.

Voluntary energy conservation projects also address the demand side of the energy equation. The Metropolitan Mayors Caucus ("MMC") initiated the Regional Dialogue forum in 1999 to brainstorm ways to address the ozone problem in the Chicago six county metropolitan areas. As a result of these discussions the Clean Air

Counts (“CAC”) initiative was created. The charter of CAC is to identify and implement voluntary measures that reduce not only VOC but also NOx emissions while also promoting economic development for the Chicago area.

The five campaigns created by CAC promote efforts to reduce emissions in communities, business and industry, development projects, households, and government facilities and operations. The initial NOx reduction goal set by CAC in 1999 was 10.9 tons per day with energy saving of 1.11 million MW hours per year by 2007. From an energy savings perspective, the 1.11 million MW hours of electrical savings equates to 900 NOx allowance credit equivalents per season from these voluntary efforts.

7.3 Conclusion

Although energy conservation initiatives such as alternative energy and demand side reductions have the possible potential of providing needed NOx reductions to enable the NOx SIP Call credit allowance allotment to be met, early contributions will be minimal but future year contributions will increase. City, State, and Federal incentives could accelerate the contribution levels and the timing of these contributions. Currently renewable energy generation, confronted with cheaper fossil-fired generation, is predicted to grow only 1.3% annually through the year 2020. Figures 7-1 and 7-2 describe the current distribution of electrical power generation energy sources and the potential NOx emissions savings from alternative energy sources.

Figure 7-1 CURRENT ENERGY SOURCES FOR ELECTRICAL POWER GENERATION IN ILLINOIS (36,180 MW)

Figure 7-2 POTENTIAL NOx EMISSIONS SAVINGS From Alternative Energy Sources (32,600 Tons NOx per Season)

8.0 Summary

The Illinois General Assembly's House of Representatives adopted House Resolution 405 on May 31, 2001, which addresses the issues the State faces in the deregulation of electric generation. The Resolution acknowledged the factors that the power generators face in their efforts to generate electricity competitively.

Illinois EPA's previous report of October 2001, discussed an overview of NOx SIP Call, its impacts on Illinois EGUs and issues related to emissions trading budget for EGUs. This report provides updated information thru October 2002.

U.S. EPA approved Illinois NOx SIP regulations to control NOx emissions from EGU, non-EGU, and cement kilns, and U.S. EPA concluded that Illinois had met the current Phase I of NOx SIP Call requirements. Illinois EPA continues to have discussions with U.S. EPA seeking a greater growth rate for Illinois' EGUs and is pursuing a favorable resolution of the growth issue.

Illinois EPA distributed 7,630 ERCs to 16 EGUs units that applied for early reduction credits. Sources can use these early reduction credits to meet the NOx budgets in 2004 or 2005.

Since the NOx trading program does not begin until May 2004, limited market trading activity has taken place. The limited trades that have occurred since the last year report have ranged from \$3,850-\$4,850 per ton of NOx as compared to \$5,000-\$6,000 per ton of NOx reported in last year's report. It would be expected that this cost will be reduced once the program is operational in 2004 and the market fully develops. Illinois EPA will track the NOx market activity and future reports will provide more data and analysis of its operation and its impact on Illinois' electricity production.

1 HOUSE RESOLUTION

2 WHEREAS, Development of Illinois' natural resources,
3 especially its coal reserves, in an environmentally sound
4 manner will stimulate the economy of this State, especially
5 in the southern part of our State; and

6 WHEREAS, Illinois is currently in the process of
7 transitioning from a fully regulated electric generation
8 market into a competitive electric generation market; and

9 WHEREAS, Recent events in the western part of the United
10 States have demonstrated the need to develop electric
11 generation resources to ensure a reliable supply of
12 electricity; and

13 WHEREAS, There is an increasing need for electricity and
14 electric generation capacity within Illinois and surrounding
15 states; and

16 WHEREAS, Illinois has the richest coal reserves in the
17 nation and it is imperative that these coal reserves be
18 developed and utilized; and

19 WHEREAS, It is paramount that any electric generating
20 facilities built in Illinois use Illinois natural resources,
21 especially Illinois coal, and protect the environment with
22 the best available technology; and

23 WHEREAS, In preparing for the coming deregulated electric
24 power generation market, Illinois must plan to take advantage
25 of the environmentally sound use of its own natural
26 resources, including Illinois coal; and

27 WHEREAS, Illinois has the opportunity to foster
28 significant economic development within the State during the
29 transition into a deregulated electric marketplace; and

30 WHEREAS, The development of power generation capacity

-2-

LRB9209078Rhrh

1 raises concerns about the environmental impact of those power
2 generation facilities; and

3 WHEREAS, Current federal regulations regarding emissions
4 of nitrogen oxides and emission credits may impede
5 development of necessary electric generation facilities; and

6 WHEREAS, Illinois must ensure that sufficient nitrogen
7 oxide emission credit are available for new electric
8 generating sources that will utilize clean coal technologies;
9 and

10 WHEREAS, Illinois' budget for nitrogen oxide emission
11 allowances is limited due to the State's current reliance on
12 nuclear power which will eventually be decommissioned and
13 therefore unavailable for generating electricity; and

14 WHEREAS, The development of clean coal technologies,
15 including coal gasification, with the vast coal reserves
16 within Illinois will enable Illinois to harvest the rewards
17 of utilizing the proven coal reserves of this State and to
18 support the further development of clean energy solutions
19 utilizing our State's natural resources as the fuel; and

20 WHEREAS, President Bush has called for the development of
21 a national energy policy; and

22 WHEREAS, Illinois is uniquely positioned to contribute to
23 the development of that national energy policy through use of
24 its extensive natural resources and coal reserves in an
25 environmentally sound manner; and

26 WHEREAS, Some adjustments in Illinois' nitrogen oxide
27 emission allowances established by the United States
28 Environmental Protection Agency will be necessary to foster
29 the development of electric generating facilities that
30 utilize Illinois natural resources and coal reserves; and

-3-

LRB9209078RHrh

1 WHEREAS, The Illinois Environmental Protection Agency is
2 charged with overseeing the nitrogen oxide emissions credit
3 program and is the most appropriate agency to make
4 recommendations to the General Assembly regarding any
5 adjustments necessary to accommodate the development of
6 sufficient new electric generating capacity; therefore, be it

7 RESOLVED, BY THE HOUSE OF REPRESENTATIVES OF THE
8 NINETY-SECOND GENERAL ASSEMBLY OF THE STATE OF ILLINOIS, that
9 we urge the United States Congress and the United States
10 Environmental Protection Agency to increase Illinois'
11 nitrogen oxide emission allowances budget; and be it further

12 RESOLVED, That the Illinois Environmental Protection
13 Agency shall prepare and submit a report to the General
14 Assembly regarding the availability of nitrogen oxide
15 emissions credits within the State and within the trading
16 region established by the United States Environmental

17 Protection Agency; the report shall contain data regarding
18 the use of emissions credits by existing electric generating
19 units, the availability of emission credits for purchase in
20 Illinois and within the trading region, the number of
21 emission credits that may be reasonably projected for use by
22 new sources in Illinois, and the relationship between the
23 cost and availability for electricity and access by existing
24 and new sources to emission credits and shall contain
25 recommendations for legislative and regulatory changes that
26 may be necessary to encourage the development of new electric
27 generating capacity in Illinois; and be it further

28 RESOLVED That the report shall be submitted to the
29 General Assembly by October 31 of each year until 2007; and
30 be it further

31 RESOLVED, That a suitable copy of this resolution be
32 delivered to the President of the United States, the Vice

-4-

LRB9209078RHrh

1 President of the United States, the Administrator of the
2 United States Environmental Protection Agency, the Governor
3 of the State of Illinois, the Director of the Illinois
4 Environmental Protection Agency, the members of the Illinois
5 Congressional delegation, and the Speaker of the United
6 States House of Representatives.
